Fm transmitter radio for car apk. Android car fm radio apk. Car fm radio price. Car radio explained. How to get capital fm on car radio.

Did you know you can listen to FM radio on a smartphone or tablet without an active data connection? You'll need an activated FM chip and the right app for it to work. This article explains how to listen to FM radio on your mobile device without a working cellular data connection or Wi-Fi. The information below should apply to any Android device. You'll need a few things to listen to FM radio on your phone without a data connection: A phone with a built-in FM radio chip: Your phone needs FM radio capability, and that capability needs to be switched on. This requires the manufacturer to activate the functionality, and the carrier to accept the feature. Wired earbuds or headphones: FM radio only works with an antenna. When you listen to an FM radio broadcast on your phone, it uses the wires in your earbuds or headphones as the antenna. An FM radio app: Even if your phone has an FM radio chip, you need an app that's capable of accessing the chip, such as NextRadio. NextRadio is an ad-supported radio app that you can download from the Google Play store. It has similar functionality to other radio apps that stream radio stations over the internet. It's also capable of tapping into your phone's FM radio receiver chip. If you have an active data connection, you can listen to streaming radio stations or local FM broadcasts. When you lose your data connection, activate the FM only mode. To activate the FM only mode in NextRadio: Launch the NextRadio app. Tap the ≡ (three horizontal lines) menu icon. Tap Settings. Tap FM only mode so that the toggle switch moves to the right. If your phone does not have an enabled FM chip, the FM only mode option isn't available. With FM only mode activated, NextRadio defaults to the built-in FM receiver chip instead of streaming local stations over the internet. If your local data service goes down or you lose cell service, you'll still be able to listen to any FM station that's in range. After you activate FM only mode in the NextRadio app, you're ready to listen to local FM radio on your phone without using your data plan. To accomplish this, you'll need wired headphones or earbuds. Wireless headphones won't work because the phone needs to use the wires as an antenna. To listen to local radio with the NextRadio app: Plug in your headphones or earbuds. Launch the NextRadio app. Tap the ≡ (three horizontal lines) menu icon. Tap Local FM Radio. Tap the station you want to listen to. If you have an active data connection and the station supports it, NextRadio displays a logo for the station and information about the song or program that you're listening to. Otherwise, you'll have to identify the station you're looking for by its call letters. NextRadio also includes a basic tuner function that works like any other FM radio. Instead of looking for a station in a list of local stations, this function presents you with a tuner that you can use to search for local stations. Either go to the station you want or use the seek function to see what's available. To use the basic tuner in NextRadio without an internet connection: Plug in your headphones or earbuds. Launch the NextRadio app. Tap the ≡ (three horizontal lines) menu icon. Tap Basic Tuner. Use the interface to search for stations: Tap the - and + buttons to adjust the frequency. Tap the back and forward buttons to use the seek functionality. When you tune into an active station, it plays automatically. Tap the stop button to stop listening. FM radio isn't a feature that any smartphone manufacturer intentionally builds into their phones. It's a byproduct of some of the chips manufacturers use, which have built-in FM receivers in addition to the features that the smartphone manufacturers are interested in. Smartphone manufacturers often disable built-in FM radio receivers. In some cases, carriers have requested the feature be disabled, possibly to encourage the use of data-hungry radio apps or to avoid consumer complaints about poor radio reception. While the FM chips for many phones are turned off, this feature is available on many handsets. Manufacturers, including HTC, LG, Motorola, and Samsung, offer a handful of phones with working FM chips. Every major cellular provider in the United States is compatible with at least one FM-enabled phone. The major exception is Apple, as there are no iPhones with activated FM chips. While the iPhone 6 and older models included FM chips, Apple says there is no way to connect an antenna to the chip. The only way to listen to FM radio on an iPhone is with a radio app, and radio apps only work when you have a decent data connection. That means you can't rely on your iPhone for FM radio during emergencies. The FCC urged Apple to enable the FM chips in their phones in 2017, but Apple responded with a claim that their latest phones don't have FM chips. Even if they did have FM chips, they don't have headphone jacks. FM chips typically aren't capable of receiving signals without headphone wires to act as an antenna. While iPhone owners can listen to FM radio with radio apps for iOS, you can't count on the local cellular and data networks remaining up during a disaster. Radio apps are great for regular entertainment use, but if you need to access crucial information during a disaster like a hurricane, invest in a battery-powered or emergency radio. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! We're going to let you in on a little secret: Your smartphone has an FM radio built right into it. Why wouldn't you know that?

Turns out that on many phones, despite having the radio built in, companies disable them or simply neglect to enable them — meaning that while the hardware is technically there to let you listen to the radio, you can't actually take advantage of it. Contents The carrierThe manufacturer The National Association of Broadcasters (NAB) has been asking mobile manufacturers to change this for years. NPR reported in 2015, and while tides do seem to be finally changing, there's still a long way to go. It's a serious issue: Apart from the simple fact that it's nice to listen to music for free without using up data, FM radio can save lives, the advocacy group told Digital Trends. "It makes sense from a public safety aspect alone." "From a public safety aspect alone, it makes sense to enable radio on smartphones. Broadcast radio plays an important role as 'first informers' in local communities, providing up-to-the-minute information when disaster strikes," said Dennis Wharton, an executive vice president with the NAB. "By equipping mobile devices with radio capability, wireless carriers allow Americans to tap into that valuable public resource." So why aren't there any laws about enabling the radio? Digital Trends reached out to the Federal Communications Commission, which promptly pointed us to a speech chairman Ajit Pai gave in February at a North American Broadcasters Association event. At the event, Pai largely agreed with the NAB's position, noting how important the radio could be in emergencies. "You could make a case for activating chips on public safety grounds alone." "Most consumers would love to access some of their favorite content over-the-air, while using one-sixth of the battery life and less data," continued Pai. Unfortunately, that's exactly where the problem lies — less data. Carriers make more money from customers who use more data. After all, if you're paying by the GB it's pretty easy to use up a good portion of your data through music-streaming services. The carrier You could argue that carriers should pressure manufacturers to enable the FM radios in their phones. You could, but carriers wouldn't. "The long and short of it is that this is totally controlled by device manufacturers, through both hardware and software. If our customers want to use FM radio on their phone and the device manufacturer has enabled it, we say rock out," T-Mobile wrote in an emailed statement to Digital Trends. This is a pretty big change from five years ago. It's only in recent years that carriers have backed away from their stance against FM radios, likely related to the rise of unlimited data. After all, in the past, the more data customers used the more they paid the carrier. Now, if a customer has unlimited data, it doesn't really matter whether they stream music or use the radio. At least some carriers will still care about you not using the FM radio. That's assuming the carrier doesn't have a stake in a streaming service, however. At the beginning of this year, news broke that Sprint had taken a whopping 33 percent stake in Tidal, a music streaming service founded by Jay-Z that's aimed at providing subscribers with high-resolution music. More recently, news leaked that Verizon was mulling investing in Pandora. The deal ultimately fell through, yet some argue it's only a matter of time before Big Red makes a similar investment in another platform. The fact is that even after the era of limited data is over, at least some carriers will still care about you not using the FM radio. While some may be more concerned about it now than others, it's likely that will change — especially since carriers clearly aim to offer their own content. (and that goes beyond just music: You've heard of Verizon's streaming TV plans, right?) But the carriers ultimately only have sway — it's the manufacturers that really make the decision to enable that FM radio chip. The manufacturer Manufacturers have made some moves to include FM radio of late. LG recently sealed a deal with NextRadio that will see radio enabled on the majority of its phones. But it's important to note the difference between having FM radios disabled and simply not having an app. The Next Radio website actually has a good list of FM radio-capable phones, which shows that most Samsung phones, many HTC phones, Motorola phones, and more have a radio ready to go — if you download the NextRadio app. But that leaves one pretty strong holdout — Apple. And Apple's not going to change its mind anytime soon. Recently, the company was urged to enable the FM radio on the iPhone after a horrific hurricane and fire season. Turns out, the newest iPhones don't even have an FM radio chip. The iPhone 7 and iPhone 8 are both chip-free when it comes to the FM radio, and we assume future models will continue that trend. Again, things boil down to why Apple may not want consumers to use the radio, and again, a possible culprit is music streaming. Apple Music has become popular, and the company may not want to jeopardize subscriptions with free radio. The tides seem to be changing. More manufacturers are adopting FM radio, and some carriers even encourage it. But there are holdouts — Apple being the biggest. And with the chip missing from the iPhone altogether, that's unlikely to change in the near future. In other words, if you want an FM radio, you may need to make the switch to Android. As far as disasters are concerned, it certainly can't hurt to have a battery-powered radio in your arsenal. Editors' Recommendations
